

GO GREEN. RECYCLE AND PROFIT !

Gas Filtration System™ by Atlantic Fuel Technology

Atlantic Fuel Technology's **Gas Filtration System**® is designed to regenerate gasoline from a containment waste product into a usable fuel. In your business thousands of gallons of gasoline must be extracted from vehicles and disposed of on an annual basis. That can be a considerable waste for any operation. No longer! Atlantic Fuel Technology has a better idea.

FILTER, RECYCLE AND REUSE

Why not filter that gasoline on site and use it in your own company fleet or sell it to a gasoline distributor? In other words, use our patent pending **Gas Filtration System**® to generate tremendous savings during this current period of high fuel costs, or generate an entirely new revenue stream for your company through its sale.

IMPROVE YOUR BOTTOM LINE

Our proprietary **Gas Filtration System**® channels old or contaminated gasoline through a series of filters that process the fuel into a useable commodity and is stored in our fire-rated Fireguard™ UL2085 storage tanks. With a daily capacity of 500 gallons, imagine the positive impact our system will have on your bottom line. The only requirement on your part is the minimal main-

tenance of changing filters on a monthly basis. That's all! And the filtering system requires only compressed air for operation. Depending on the dispensing system you choose electric connections may not be required.

DRILL SPEEDS REMOVAL

An optional AFT gas drill can be added to the system for easy removal of fuel from a recycled vehicle.
